

Neurobotics™

The Future is Here. Real. Now.

Neurobotics LLC: Seed Capital Allocation Strategy

[1.0] Executive Summary of Capital Requirement

Neurobotics LLC is seeking Seed Capital to transition the Silicon-Based Utility Droid (SBUD) architecture from our multi-node software emulation array to a highly optimized, dual-silicon hardware substrate.

Unlike SaaS or cloud-native AI startups, Neurobotics does not require massive capital outlays for cloud compute credits, API token usage, or renting server farms. Our proprietary architecture executes locally on bare-metal hardware. Having already established our corporate LLC and successfully filed foundational USPTO trademarks ("Neurobotics", "SBALF", and "Bubo Sapiens"), 100% of the invested capital will be deployed directly into hardware miniaturization, physical lab expansion, and ongoing intellectual property defense.

[2.0] Strategic Capital Allocation (The 18-Month Runway)

The following outlines the precise, non-stochastic deployment of the requested capital over the next 18 months to achieve the Phase 1 Alpha Demo.

[2.1] Core R&D & Hardware Prototyping (50%)

The core objective of this funding round is the execution of Kenneth Renshaw's custom silicon architecture.

- **Microchip PIC64 & PolarFire SoC Development Kits:** Procurement of enterprise-grade development boards to finalize Phase 2 hardware verification.
- **ASIC/FPGA Toolchain Licensing:** Securing the necessary enterprise software licenses to synthesize our proprietary Tier 6/7 vector algebra into native FPGA gate-level logic.
- **PCB Fabrication (Small Batch):** Just-In-Time (JIT) manufacturing costs for the first run of the consolidated SBUD-SB2 (Single Board Brain) substrates.

[2.2] Operational Runway & G&A (40%)

Neurobotics operates with an exceptionally lean executive team. Capital will be allocated to maintain operations, secure the laboratory, and bring on specialized talent.

- **Lab Expansion & Hardware Test Benches:** Upgrading the Yale, Oklahoma lab with oscilloscopes, logic analyzers, and thermal testing chambers to verify our <25W power consumption and zero-thermal-throttling guarantees.
- **Biomechanical Chassis Acquisition:** Procurement of baseline mechanical actuators and servo platforms to physically test the CMAC motor-control matrix.
- **Secure Infrastructure:** Hardening the physical lab environment and local servers to meet DISA-STIG compliance standards and protect the proprietary code repositories.
- **Strategic Talent & Operations:** Covering baseline corporate overhead and contracting specialized FPGA routing engineers to assist the CSO in the final gate-level logic routing of the PolarFire fabric.

[2.3] IP Protection & Regulatory Compliance (10%)

The Neurobotics dual-licensing framework and hardware moat require aggressive legal scaffolding. Building upon our already established LLC and our active trademark applications for "Neurobotics", "SBALF", and "Bubo Sapiens", this capital ensures our ongoing defense.

- **Defensive Patent Filings:** Executing comprehensive utility patents around the Tier 6/7 Aristotelian Syllogism Engine and the hardware-enforced Vagus Nerve kill switch.
- **Licensing Architecture:** Retaining specialized IP counsel to finalize and enforce the strict terms of the Commercial/Defense Master Licensing Agreements (MCLA) and the AGPL-3.0 Community Tier.

[3.0] Financial Philosophy: The "Esse Quam Videri" Standard

Neurobotics rejects the bloated burn rates typical of Silicon Valley AI startups. We do not spend capital on performative marketing, luxury office spaces, or leased cloud dominance. Every dollar deployed is treated as an engineering resource designed to yield a mathematically verifiable hardware milestone.
