

Neurobotics™

The Future is Here. Real. Now.

Neurobotics Company Fact Sheet

The Mission Neurobotics is pioneering the next era of biologically-inspired deterministic systems. We engineer austere, zero-fail autonomy built on rigorous physics to provide a deterministic, edge-native cognitive substrate for next-generation autonomous systems.

Company Snapshot

- **Leadership:** Founded by Kenneth Renshaw (CEO/CSO, 50+ years of neuroscience and robotics study) and Shannon Renshaw (COO/CCO, 35+ years of operations and compliance experience).
- **Headquarters:** 361 N C Street, Yale, OK 74085.
- **Core Focus:** Deep-tech hardware and software research developing deterministic cognitive systems for robots, drones, industrial environments, and specialized military applications.

Core Differentiators

- **Edge-Native Sovereignty:** The SBUD architecture operates 100% off-grid with zero cloud reliance. The entire 7-Tier cognitive stack is compressed onto a \$100mm $\times$ 100mm custom silicon board drawing less than 25W of power.
- **Hardware-Enforced Determinism:** Autonomy is driven by RISC-V and FPGA-inspired bare-metal frameworks that execute logic with absolute mathematical certainty. A hardware-enforced veto executes natively in the CPU pipeline, providing an un-hackable, nearly instantaneous physical override.
- **Biomimetic Architecture:** The architecture functions as a deterministic digital twin of biological neurology, mapping anatomical pipelines directly into silicon. It fuses Global Workspace Theory (GWT) with Integrated Information Theory (IIT-Phi) to achieve autonomous, biological-grade cognition.
