

Neurobotics LLC: Commercial Licensing Prospectus

Dual-Licensing Framework: Balancing Open Science with Secure Commercial Execution

At Neurobotics, we empower the autonomous industry with a true, deterministic drop-in brain and nervous system. To accommodate the diverse needs of academic researchers, commercial manufacturers, and federal defense integrators, we operate on a strict Dual-Licensing Framework.

This prospectus outlines our available hardware modules and the legal pathways for integrating Neurobotics Intellectual Property into your chassis.

I. The Modular Neurotronic Brain: Product Matrix

Our architecture is delivered via a modular, 4"x4" hardware ecosystem designed to operate under 15W of power. Partners may license individual components or the fully consolidated SBUD architecture based on their integration needs.

Board Type	Designation	Architecture Level	Key Feature & IP Status
Board One	The Somatic Controller	Tiers 1–5	OSS Drop-in Lower Nervous System (High-speed telemetry & spinal reflex arcs)
Board Two	The SBUD Neocortex	Tiers 6–7	Aristotelian Syllogism Engine (Deterministic learning & knowledge representation)
Board Three	The SBALF Neocortex	Apex Autopoietic	STRICTLY CONFIDENTIAL IP (Secured Internal Development Only)
Board Four	The Galvanic Barrier	Hardware Shield	Optoisolated Servo Protection (Shields core logic from spiking servos)
Board Five	The SBUD-SB2	Complete Tiers 1–7	Single Board Brain Consolidation (Maximum processing density)

II. Licensing Pathways & Tiers

We offer three distinct tiers of engagement to ensure our technology scales securely from the laboratory to the battlefield.

1. Community Tier (AGPL-3.0)

Engineered for academic research and Open-Source validation.

- **The Framework:** Free to use, modify, and distribute for **non-commercial** purposes.
- **The Catch:** Governed by strict copyleft protection. Any modifications or integrations made using this tier must also be made open-source and publicly available under the AGPL-3.0 license.
- **Ideal For:** University robotics labs, independent open-source developers, and non-profit research institutions testing Board One (The Somatic Controller) integrations.

2. Enterprise & Defense (MCLA)

Master Commercial Licenses for proprietary, closed-source integrations.

- **The Framework:** The MCLA provides a full legal exemption from the AGPL-3.0 copyleft requirements. This allows commercial manufacturers to integrate Neurobotics hardware (such as the SBUD-SB2 or Board Two Neocortex) into proprietary, closed-loop systems without being forced to open-source their own chassis code.
- **Security & Compliance:** Fully supports integrations requiring DISA and STIG compliance for federal and defense applications.
- **Ideal For:** Commercial robotics manufacturers, autonomous vehicle developers, and defense contractors.

3. Hardware Pilots (HEA)

Hardware Evaluation Agreements for hands-on, bare-metal validation.

- **The Framework:** A direct partnership program allowing vetted organizations to field-test physical, bare-metal SBUD evaluation chassis.
- **The Scope:** Includes off-grid integration testing, rigorous chain-of-custody tracking, and federal validation protocols.
- **Ideal For:** Enterprise partners requiring physical proof-of-concept testing prior to executing an MCLA or initiating mass manufacturing.

III. Next Steps & Integration

The era of relying on tethered, probabilistic cloud compute is over. To begin integrating deterministic, edge-native architecture into your physical systems, please contact our engineering and legal teams to initiate an HEA or MCLA.
